Overarching aims of this course

- ▶ Develop a critical approach to all steps in a project, which methods are most relevant, which natural laws and physical processes are important. Sort out initial conditions and boundary conditions etc.
- ▶ This means to teach you structured scientific computing, learn to structure a project.
- ▶ A critical understanding of central mathematical algorithms and methods from numerical analysis. In particular their limits and stability criteria.
- ▶ Always try to find good checks of your codes (like solutions on closed/analytical form)
- ▶ To enable you to develop a critical view on the mathematical model and the physics.

Topics covered in this course

- ▶ Quantum Monte Carlo methods
- ▶ Linear algebra and eigenvalue problems
- ▶ High-performance computing aspects

Learning outcomes

- ▶ has a thorough understanding of how computing is used to solve scientific problems
- ▶ knows some central algorithms used in science
- ▶ has knowledge of high-performance computing elements: memory usage, vectorization and parallel algorithms
- ▶ understands approximation errors and what can go wrong with algorithms
- ▶ has experience with programming in a compiled language (Fortran, C, C++)
- ▶ has experience with debugging software
- ▶ has experience with test frameworks and procedures
- ▶ can critically evaluate results and errors
- ▶ understands how to increase the efficiency of numerical algorithms and pertinent software
- ▶ understands tools to make science reproducible and has a sound ethical approach to scientific problems

Computing knowledge

Our ideal about knowledge on computational science
